

# *Listening to Oral History: Emotion Annotation and Recognition in the ACT UP Oral History Project*

**Francisca Pessanha**, Ian Padovani, Justus van Klaveren, Heysem  
Kaya, Almila Akdag and Judith Masthoff

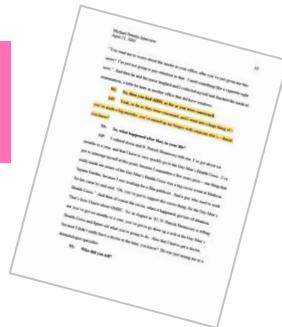

Utrecht University

*The “deep dark secret” of oral history, is  
that nobody spends much time listening to  
or watching recorded and collected  
interview documents.*

**Michael Frisch**

*Computational techniques  
have brought new insights to  
the field of oral history, with  
methods such as:*

*Automatic Speech  
Recognition*   
*and*  
*Natural Language  
Processing.* 

*The interview process is  
“a performance in  
search of a text”.*

*Reading only the  
interview transcriptions  
results in missing the  
performance itself.*

Michael Petrelis Interview  
April 21, 2003

“You want me to worry about the smoke in your office, after you’ve news? I’m just not going to pay attention to that. I need something now.” And then he and the nurse laughed and I collected myself and

examination, a little bit later in another office that did have windows.

**SS:** So, then you had AIDS, as far as you were concerned.

**MP:** Yeah, as far as they were concerned, and I went into a huge thing of –

you’ve made a big mistake, you’ve mixed up my biopsy with someone else’s – denial, you know?

**SS:** So, what happened after that, in your life?

**MP:** I calmed down and N. Patrick Hennessey tells me, I’ve got about six months to a year, and that I have to very quickly go to the Gay Men’s Health Crisis. I’ve got to interrupt myself at this point, because I remember a few years prior – one thing that

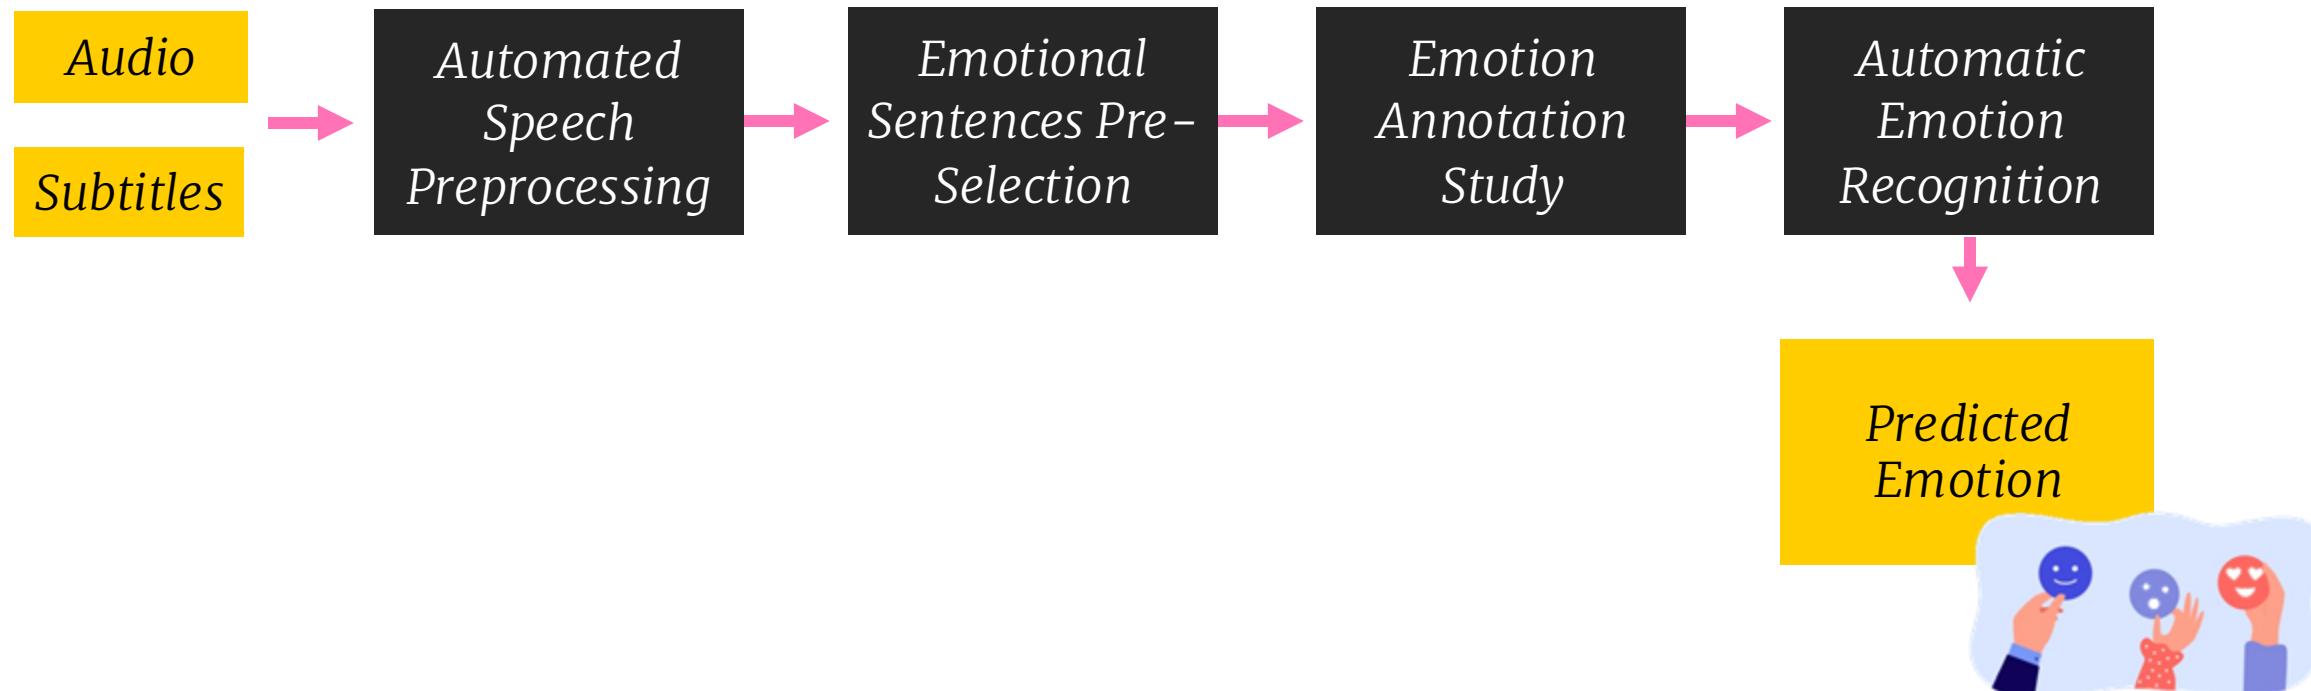

# Why the ACT UP Oral History Project?

187 interviews, 303 hours of testimony.

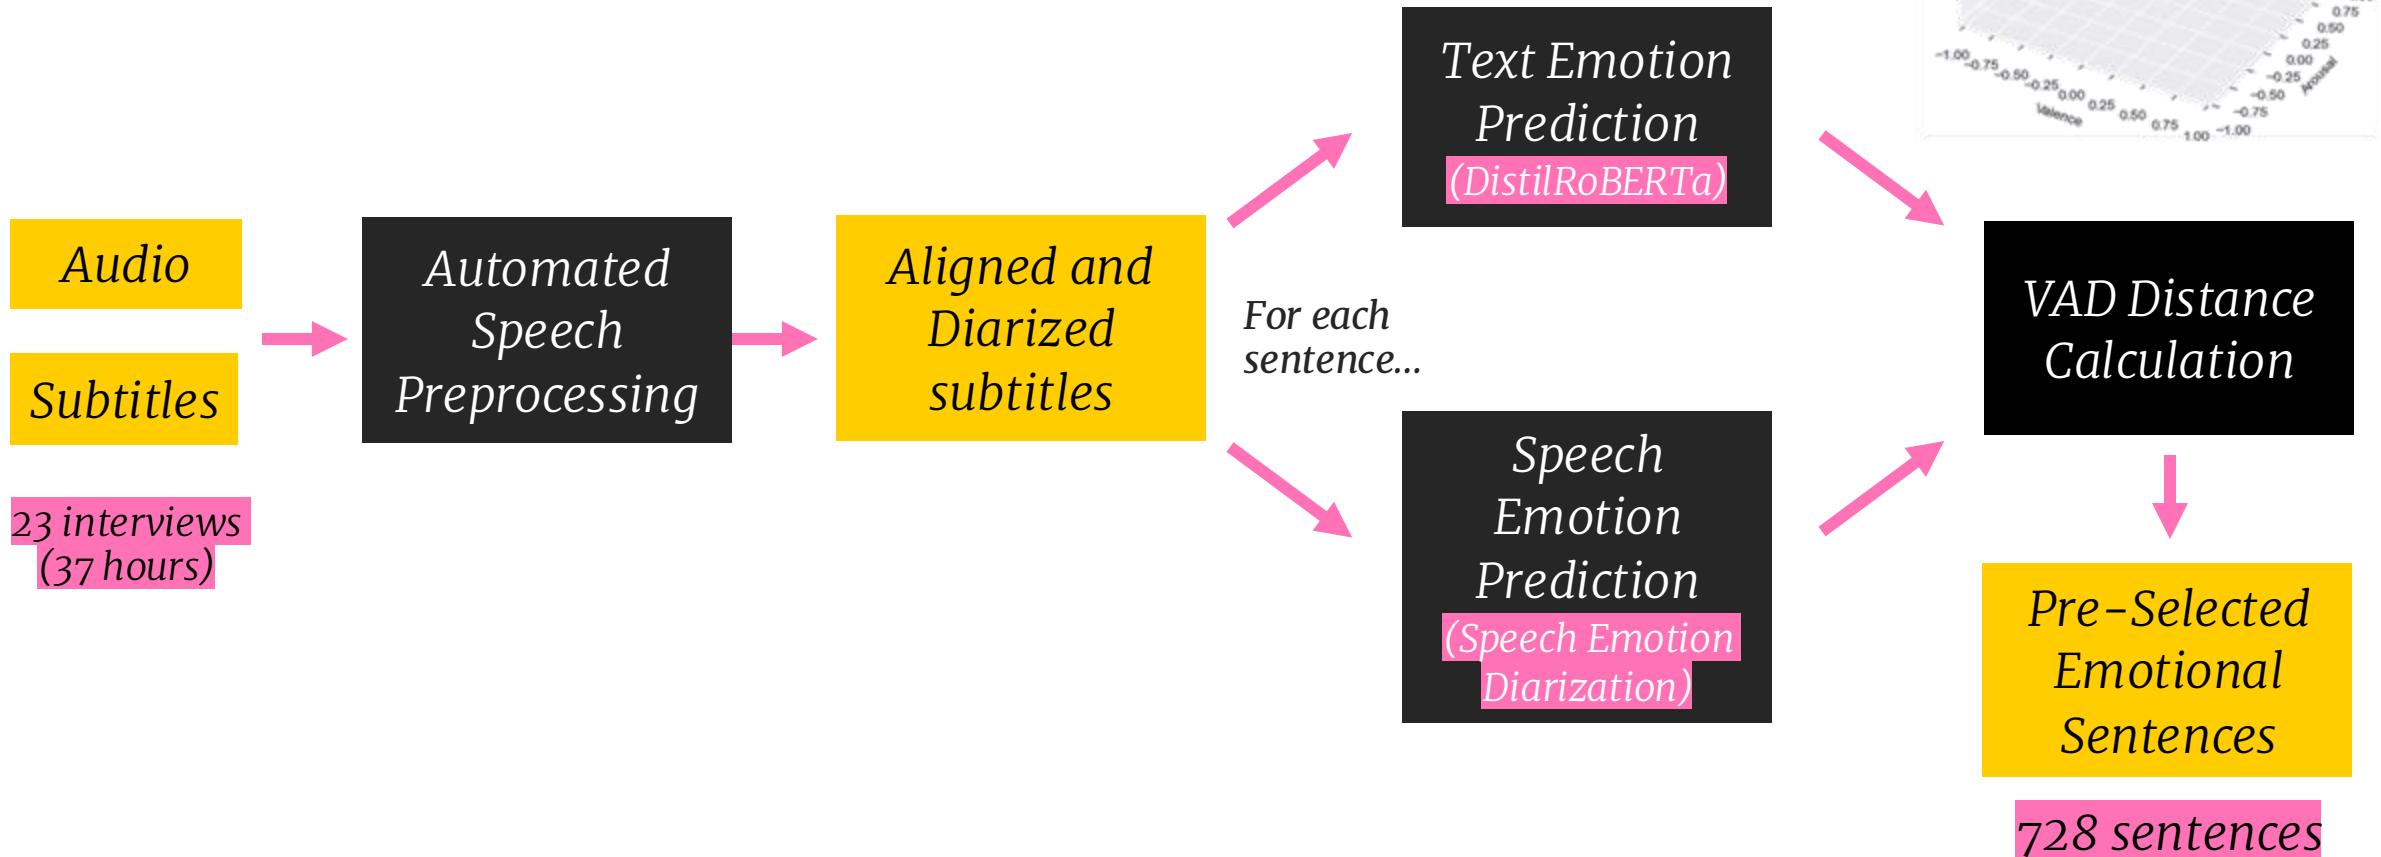

Themes: grief, fear, “righteous anger.”

Conversational, emotionally charged

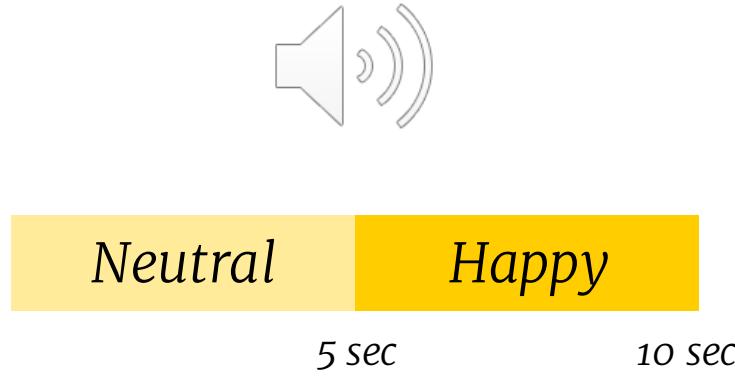

# *Our approach – Overview*

# *Our approach* – Sentence Pre-Selection

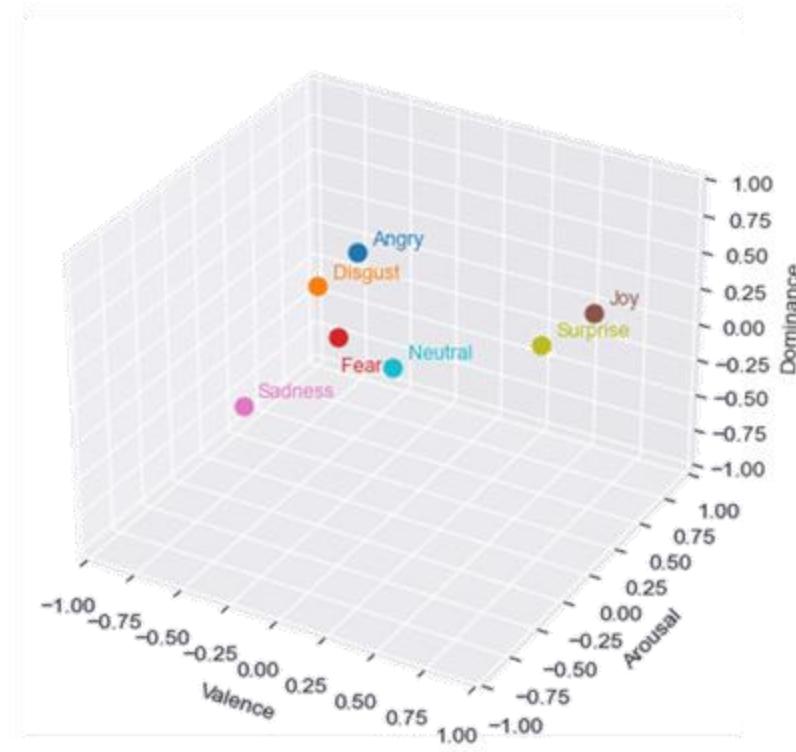

# Our approach – Sentence Pre-Selection

Well, my grandmother gets all upset and says, you know, “Oh, this is some Mafia-controlled baby beauty contest!”.

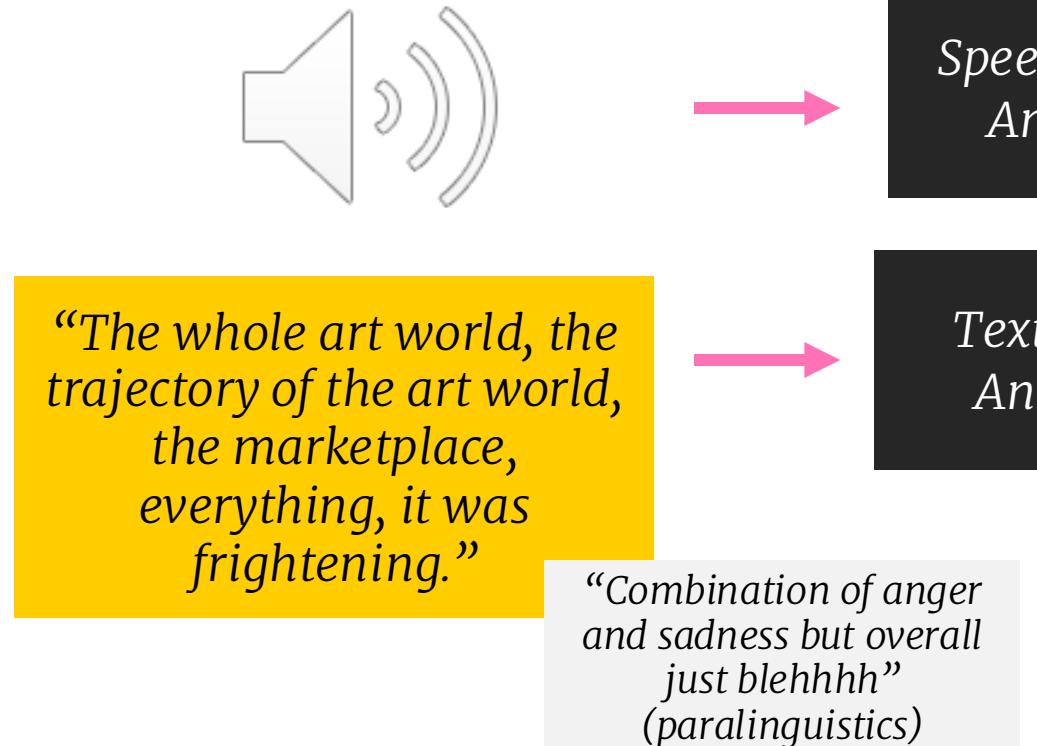

Anger

$$distance(paralinguistics, linguistics) =$$

$$\frac{distance(neutral, anger) * t_{neutral} + distance(happy, anger) * t_{happy}}{t_{total}}$$

# *Our approach – Emotion Annotation Study (Trial 1)*

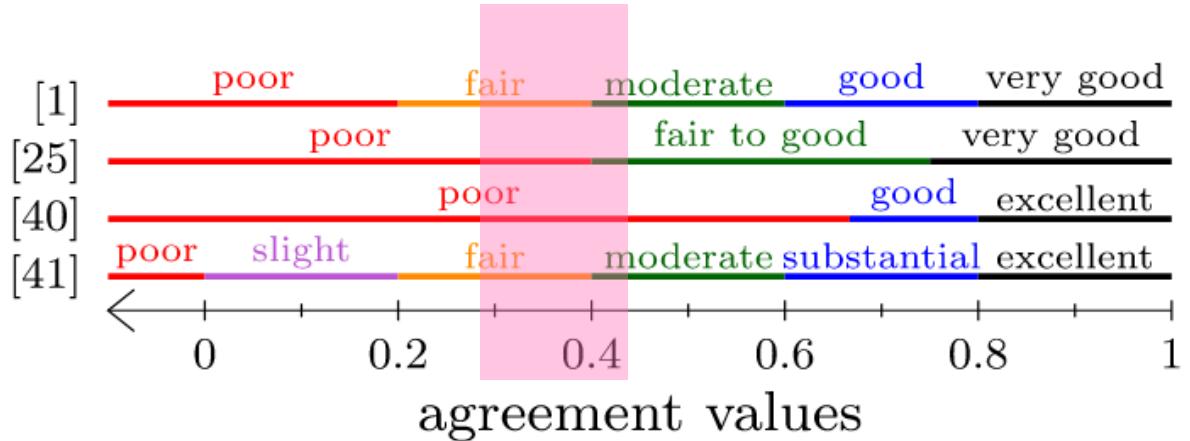

- ✓ Educational Setting
  - ✓ 32 annotators
  - ✓ 3 to 4 annotators per sentence (per modality)
  - ✓ Annotations based on common sense
- Emotions:** 6 Ekman basic emotions (happy, sad, angry, fear, disgust, surprise) + neutral

# *Our approach – Emotion Annotation Study (Trial 1)*

*Krippendorff's alpha:*

- *Linguistics: 0.42*
- *Paralinguistics: 0.31*

**Challenge #1:** There are different interpretations for the Krippendorff's alpha making it challenging to interpret results consistently

# Our approach – Emotion Annotation Study (Trial 1)

Let's consider that "good" corresponds to  $\kappa$  or  $\alpha > 0.67$ .

### Emotionality in Speech

Spoken language communicates more than just words. Speakers use tone, pitch, and other nonverbal cues to express emotions. In emotional speech, these cues can strengthen or even contradict the meaning of the words—for example, irony can make a positive phrase sound sarcastic. For this research, we will focus on three basic emotions plus neutral:

- Anger
- Happiness
- Sadness
- Neutral

This may seem like a small set, but it's a great starting point for analyzing emotions in such a large collection—**303 hours of interviews!** (That's 13 days of nonstop listening! 😊)

### The ACT-UP Oral History Project

You will be annotating short audio clips extracted from the ACT UP (AIDS Coalition to Unleash Power) Oral History Project developed by Sarah Schulman and Jim Hubbard. This archive features interviews with individuals who were part of ACT UP during the late 1980s and early 1990s, amidst the AIDS epidemic. In each video, the subjects talk about their life before the epidemic, how they were affected by AIDS and their work in ACT UP.

### What will you be annotating?

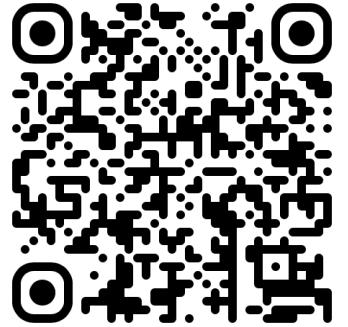

You will annotate one emotion per short audio clip, based on the following criteria:

- **Predominant Emotion:** The emotion expressed with the highest intensity. Emotions can be complex, and multiple emotions may occur at the same time.
- **Perceived Emotion at the Time of Recording:** In Oral History Archives, interviewees discuss their past. However, you should annotate the emotion they appear to feel at the time of recording, NOT what they felt during the event they describe.
- **Speech Emotionality:** Focus on how something is said rather than what is said. For example, if a friend recounts an awful day with humor, the content may be sad, but the delivery is joyful. In this case, linguistic emotionality (content) would be classified as sad, while paralinguistic emotionality (tone and delivery) would be classified as joyful.

Open-source annotation tool developed for Trial 2

- ✓ Online Setting
- ✓ 18 annotators
- ✓ 2 annotators per sentence
- ✓ Context before and after the target sentence
- ✓ Extensive instructions

**Emotions:** happy, sad, angry and neutral

# *Our approach – Emotion Annotation Study (Trial 2)*

*Participants' Annotations*

*Emotions*

*Happy, Sad, Angry,  
Neutral*

*Confidence*

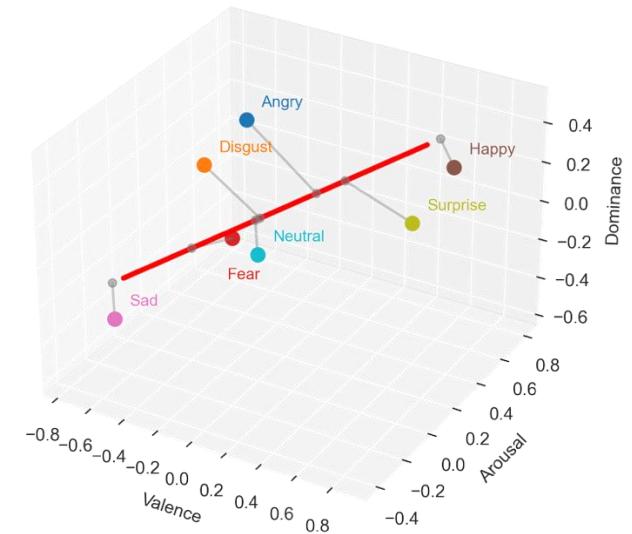

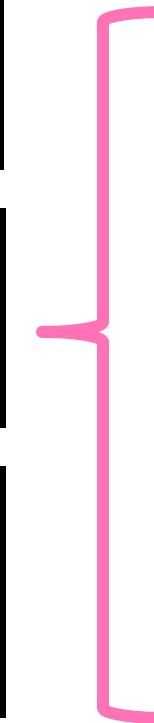

*Very uncertain →  
Very confident*

*Nominal Krippendorff's  $\alpha$*

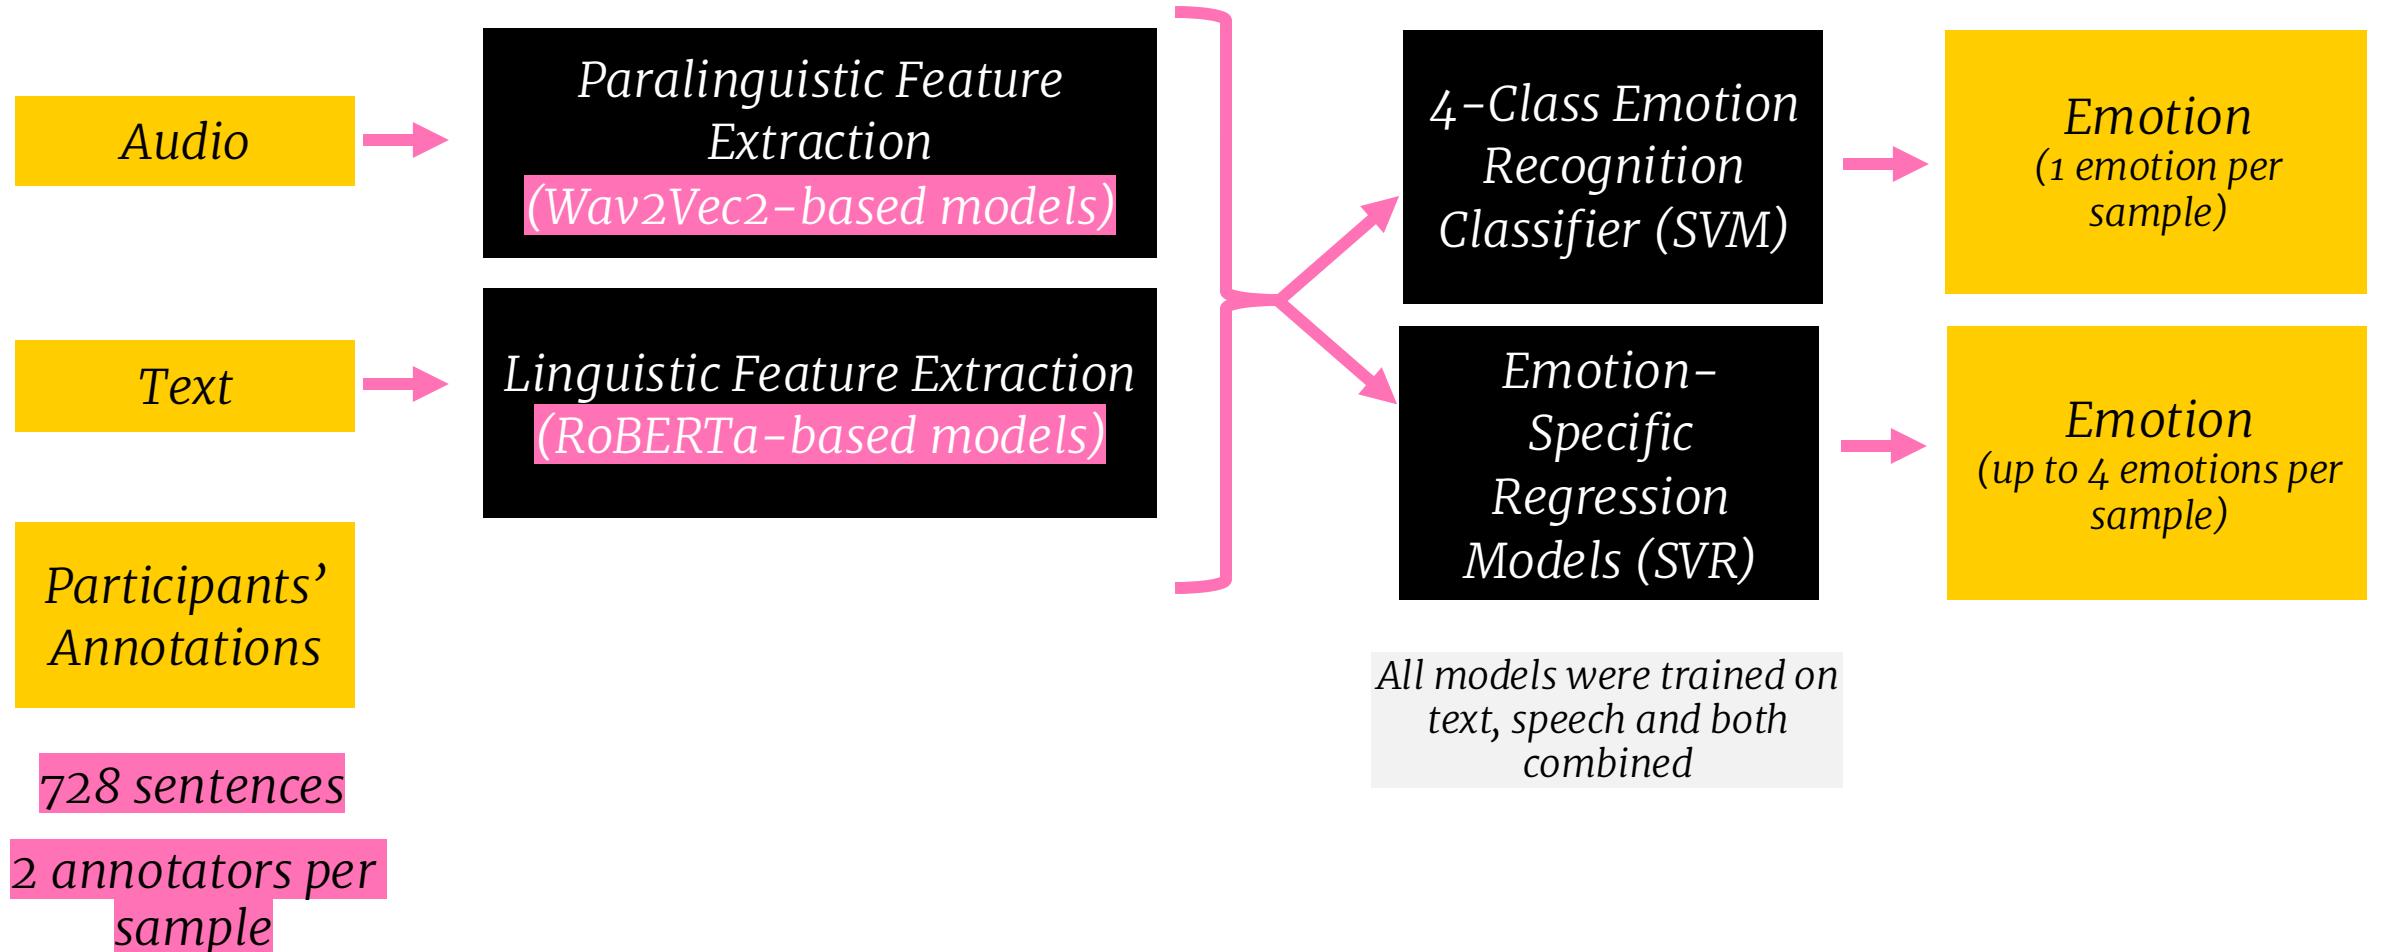

*Proposed Weighted (Ordinal)  
Krippendorff's  $\alpha$*

*Correlation between  
confidence and agreement*

*Visualization of emotion  
coordinates in the VAD space with  
the 1st PCA direction.*

# *Our approach* – Emotion Recognition

# Our approach – Emotion Recognition

Annotator 1

I am **very confident**  
**sadness** is present in this example.

“And I felt scared, you know,  
because even inside the city hall,  
they’re gunning us down.”

Annotator 2

I am **somewhat uncertain**  
**happiness** is present in this example.

“The high pitch in the word “scared”  
makes me feel like he’s happy saying it,  
which is why I used “happy” — it  
sounds like he’s relieved while saying  
it.”

# *Our approach* – Emotion Recognition

## 4-Class Emotion Recognition Classifier

Sample 1.1

Audio

Sad

Sample 1.2

Audio

Happy

Each annotation  
is seen as an  
independent  
sample for both  
training and  
testing.

## 4 Emotion-Specific Regression Models

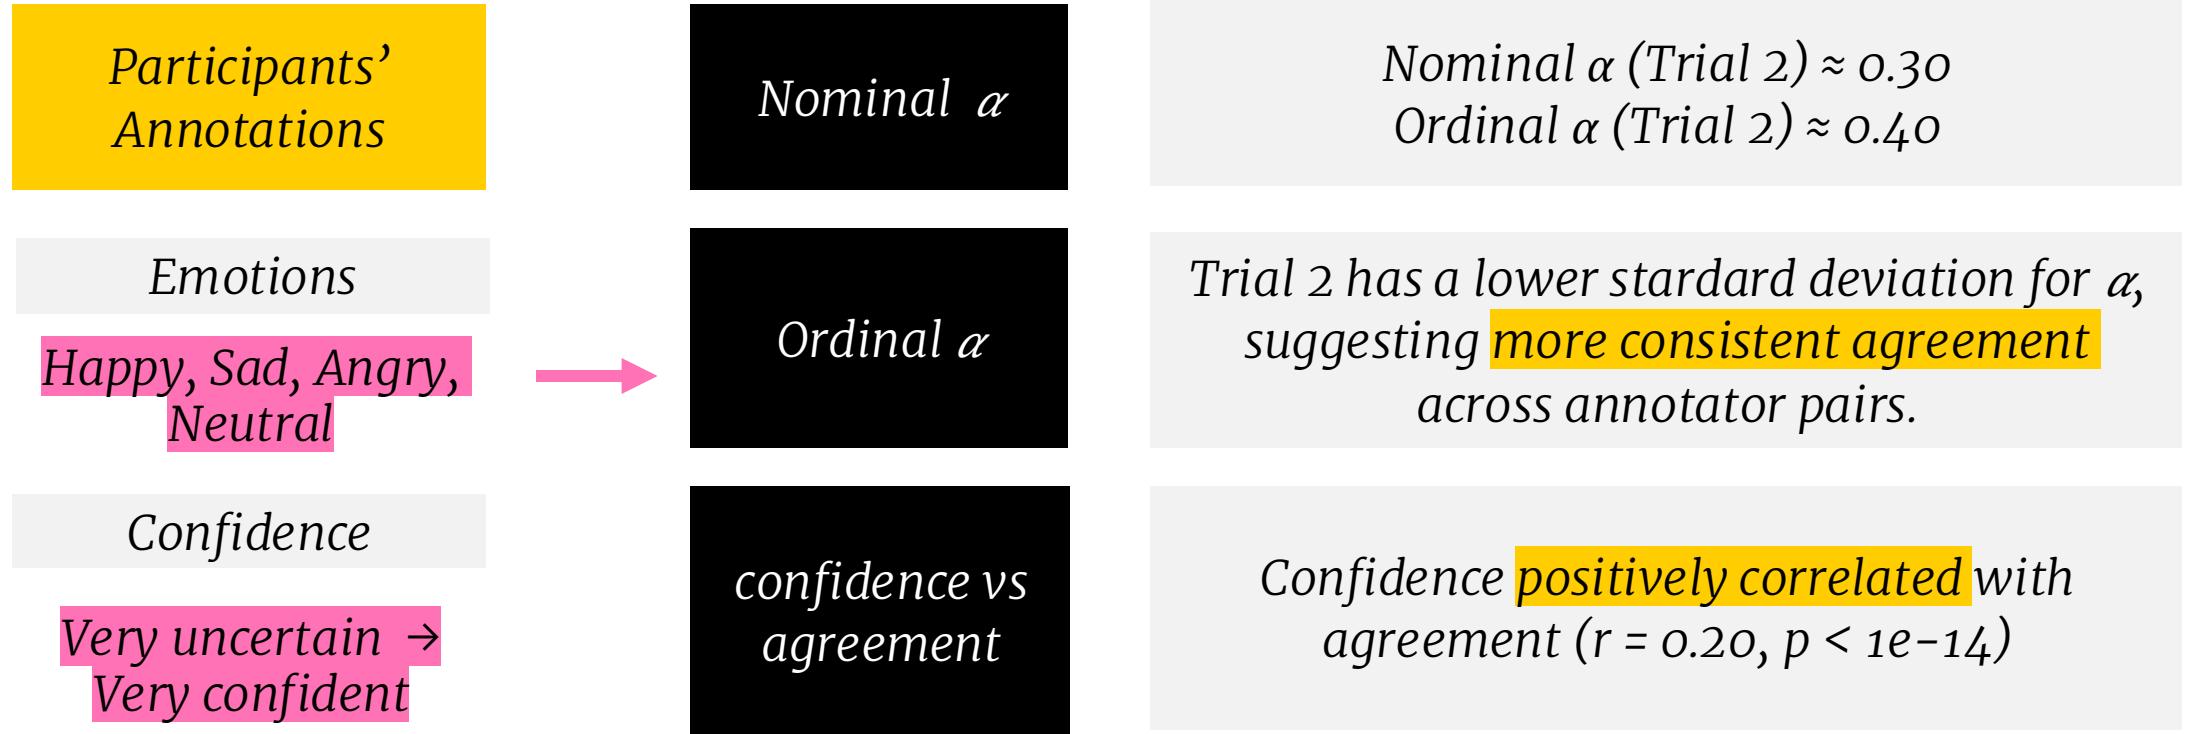

Sample 1 (Happy, Sad, Angry, Neutral)

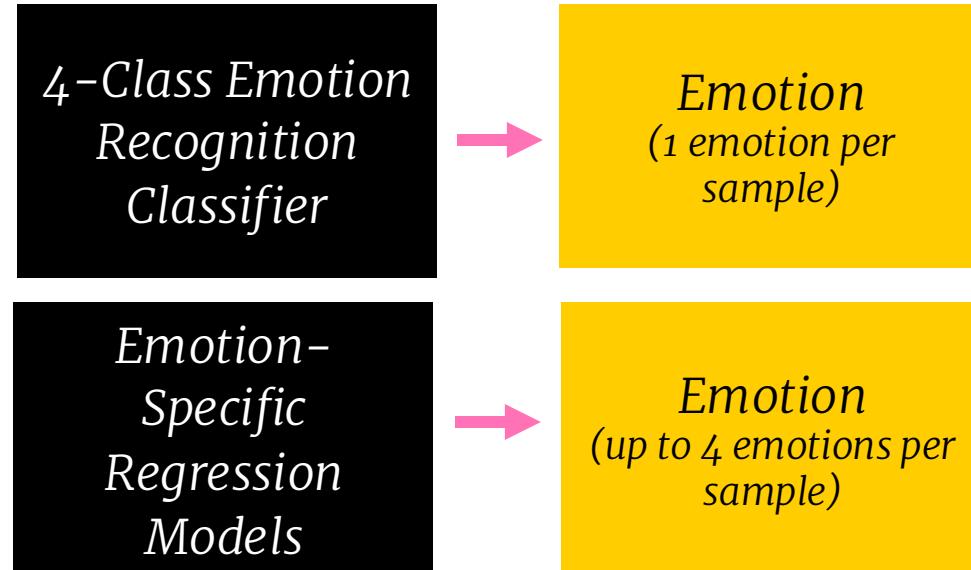

(1, 1, 0, 0)  
or  
weighted for  
confidence  
(2, 5, 0, 0)

Annotations are combined into a single  
ground truth label.  
The threshold for emotion binarization  
defined iteratively during cross-validation.

# Insights – Emotion Annotation Study

# Insights – Emotion Recognition

All models were trained on text, speech and both combined

Speech > Text for emotion recognition

Best model:  $F_1 \approx 0.66$   
(emotion-specific regression, paralinguistic modality)

Comparable to state-of-the-art for emotion prediction in Oral History Archives

# Conclusion and Future Work

WE'RE  
FIRED UP

*Tools show strong potential for analyzing emotion in OHA*

*Towards listening at scale: new ways to engage archives*

*Next: deep learning for ambiguity + full ACT UP archive*
